Mountain Weather Forecast

Ground Conditions Supplement

Date: Friday 27 January 2023 Location: Skiddaw summit at 10:32 Full report: A beautiful sunny day in the North Lakes with light winds and inversion conditions developing over the eastern fells during the morning. Overnight frost down to relatively low levels and rime ice on cold windward surfaces soon melted away on sunny south-facing slopes. The majority of the fells are snow-free apart from old drifts in sheltered depressions, however, larger areas of snow are still present, predominantly on Helvellyn and its surrounding fells and most notably on shady north and east-facing slopes above 800m. In these areas accumulations remain up to knee-deep in-depth and cornices (snow overhangs) are present around corrie rims. All the snow encountered today was hard (old refrozen snow) and with summit temperatures at or near freezing tomorrow, much of it will remain hard and icy. The Helvellyn edges are a mixture of exposed rock and snow, and anyone considering these or similar steep and exposed routes tomorrow are advised to carry an ice axe and crampons/microspikes. Full winter clothing (warm and waterproof) including hats and gloves, as well as a map, compass, and headtorch, are all essential for anyone venturing into the high fells. Temperature: plus 3.5 C, Maximum wind speed 5.5 mph, Wind chill: plus 0.7 C, Average wind speed: 4.6 mph
